$$
\begin{aligned}
& U(1,2)=(1)(2)=2 \\
& U(2,1)=(2)(1)=2 \\
& U(5,2)=(5)(2)=10
\end{aligned}
$$

b.

| Bundle | Quantity <br> of $\boldsymbol{X}$ | Quantity <br> of $\boldsymbol{Y}$ | Utility |
| :---: | :---: | :---: | :---: |
| $A$ | 2 | 2 | 4 |
| $B$ | 10 | 0 | 0 |
| $C$ | 1 | 5 | 5 |
| $D$ | 3 | 2 | 6 |
| $E$ | 2 | 3 | 6 |

From the table, $U(D)=U(E)>U(C)>U(A)>U(B)$ and we have the ranking (> denotes strictly preferred, $\sim$ denotes indifferent)

$$
D \sim E>C>A>B
$$

c. Good $\mathbf{Y}$

The "more is better" assumption is satisfied.
d.

| Bundle | Quantity <br> of $\boldsymbol{X}$ | Quantity <br> of $\boldsymbol{Y}$ | $\boldsymbol{M U}_{\boldsymbol{x}}$ | $\boldsymbol{M U}_{\mathbf{Y}}$ |
| :---: | :---: | :---: | :---: | :---: |
| F | 1 | 2 | 2 | 1 |
| G | 2 | 2 | 2 | 2 |
| H | 1 | 3 | 3 | 1 |

e. Comparing bundle $F$ and $G, M U_{X}=2$ for both bundles. $M U_{X}$ is constant.
f. Marginal utilities can be calculated as partial derivatives of the utility function. Since $U=X Y$, the marginal utility of $X$ is $M U_{X}=\frac{\partial U}{\partial X}=Y$, and the marginal utility of $Y$ is $M U_{Y}=\frac{\partial U}{\partial Y}=X$.
g. Indifference curves corresponding to the consumer's utility function are convex to the origin. The slopes of these indifference curves therefore change as the consumer gives up $Y$ to get more $X$. Specifically, $M R S_{X Y}=\frac{M U_{X}}{M U_{Y}}=\frac{Y}{X}$. This $M R S$ decreases as the consumer gives up $Y$ to obtain more $X$.
h. The Lagrangian is

$$
\mathcal{L}(X, Y, \lambda)=X Y+\lambda[80-2 X-4 Y]
$$

The first-order conditions (partial derivatives of this equation with respect to $X, Y$, and the Lagrange multiplier $\lambda$, respectively) are

$$
\begin{aligned}
& \frac{\partial \mathcal{L}}{\partial X}=Y-\lambda(2)=0 \\
& \frac{\partial \mathcal{L}}{\partial Y}=X-\lambda(4)=0 \\
& \frac{\partial \mathcal{L}}{\partial \lambda}=80-2 X-4 Y=0
\end{aligned}
$$

Solving the first two equations for $\lambda$ and setting them equal to each other, we find

$$
\lambda=\frac{Y}{2}=\frac{X}{4}
$$

Rearranging, we see that

$$
\begin{aligned}
4 Y & =2 X \\
X & =2 Y
\end{aligned}
$$

We can combine this with the third of the first-order conditions that tells us the budget constraint relationship:

$$
\begin{aligned}
80 & =2(2 Y)+4 Y \\
8 Y & =80 \\
Y & =10 \\
X & =2(10)=20
\end{aligned}
$$
